PROJECTS

Product Inventory

Managing inventory is crucial for businesses to operate smoothly and ensure they have adequate products to meet customer demand. “Keeping Stock” focuses on maintaining the right inventory levels at the right times, avoiding both excess and shortage. This concept leverages smart technology and collaborative efforts to predict customer needs and preferences, thereby enhancing customer satisfaction and profitability.

MadiBook-Hospital Management System

Medibook is a comprehensive hospital management system built using PHP Laravel, designed to streamline hospital operations through dedicated portals for Admin, Doctor, Patient, Receptionist, and Cashier roles. It features multi-authentication, appointment booking and management, patient medical records, billing and invoicing with PDF generation, and a chatbot assistant for handling service-related queries. The system offers role-based access control, responsive dashboards, and a clean, modern interface to improve hospital workflow efficiency, data security, and overall patient service experience.

Chatbot

The Chatbot is an AI-powered conversational assistant developed using Laravel, JavaScript, and Blade templates, designed to enhance user interaction and support within web applications. It verifies users through email, handles new registrations directly within the chat, and assists with order, service, and product-related queries. The chatbot dynamically fetches and displays user-specific data in interactive tables, offers numbered options for quick issue selection, and maintains a guided conversation flow. It also features a dark/light theme toggle, animated UI interactions, and a friendly, responsive interface aimed at improving customer engagement and support efficiency.
